

40002-0007

09/613,616

IN THE CLAIMS:

Please amend the claims as follows:

1. (currently amended) A wireless access point for use in a local area network for transmitting data among networked devices, the wireless access point being incorporated into a first networked device and comprising:

a wireless transceiver for wireless receiving and transmitting a data signal among said networked devices; and

a controller for controlling said transceiver to receive and transmit said data signal among networked devices within range of said transceiver so as to wirelessly relay said data signal among said networked devices in accordance with a designated recipient device of said data signal specified by said data signal;

wherein said controller both (1) transmits data originating on said first networked device in which said wireless access point is incorporated and (2) relays data in accordance with a designated recipient among any of the other said networked devices within range of said wireless access point.

2-3. (cancelled)

4. (currently amended) The wireless access point of claim 3 claim 23, wherein said power connector is a pair of prongs extending directly from said housing for connection to a wall outlet as said power supply.

40002-0007

09/613,616

5. (currently amended) The wireless access point of ~~claim 3~~ claim 23, wherein said power connector is a threaded connector for connection to a light bulb socket as said power supply.

6. (currently amended) The wireless access point of ~~claim 3~~ claim 23, further comprising an alternate power source.

7. (currently amended) The wireless access point of claim 6, wherein said alternate power source ~~comprises a solar power unit is rechargeable and said access point further comprises a charger connected between said power connector and said alternate power source.~~

8. (original) The wireless access point of claim 1, further comprising a power-line modem connected to a power line, wherein said controller further controls said power-line modem to receive, transmit and relay said data signal among networked devices connected to said power line through respective power-line modems.

9. (original) The wireless access point of claim 8, further comprising a connection to said power-line for drawing power to power said access point.

10-11. (cancelled)

12. (currently amended) A method of extending a local area network with one or more wireless access points each comprising a wireless transceiver for wirelessly receiving and transmitting a data signal among networked devices, the method comprising:  
connecting a said wireless access point to a power source;

40002-0007

09/613,616

controlling said transceiver to receive and transmit said data signal among networked devices within range of said transceiver so as to wirelessly relay said data signal among said networked devices in accordance with a designated recipient device of said data signal; and  
providing an electrical outlet on said wireless access point such that another device can be connected to said power source through said wireless access point.

13. (original) The method of claim 12, wherein said access point has no wired connection to said local area network, but communicates with other networked devices of said network solely through said wireless transceiver.

14. (cancelled)

15. (currently amended) The method of ~~claim 14~~ claim 12, further comprising incorporating said wireless access point in an outlet strip, said electrical outlet being one of a plurality of electrical plug outlets of said outlet strip further comprising providing a pair of prongs for connection to a wall outlet as said power supply.

16. (currently amended) The method of ~~claim 14~~ claim 12, wherein said connectins to a power source further comprising providing a threaded connector for connection to a light bulb socket as said power supply, said electrical outlet being a second light bulb socket and said other device being a light bulb.

17. (currently amended) The method of ~~claim 14~~ claim 12, further comprising providing an alternate power source for said access point.

18. (original) The method of claim 17, wherein said alternate power source is rechargeable and said method further comprises recharging said alternate power source.

40002-0007

09/613,616

19. (original) The method of claim 12, further comprising:  
connecting said access point to a power line through a power-line modem; and  
controlling said power-line modem to receive, transmit and relay said data signal  
among networked devices connected to said power line through respective power-line  
modems.

20. (original) The method of claim 19, further comprising connecting said  
access point to said power-line for drawing power to power said access point.

21-22. (cancelled)

23. (currently amended) A wireless access point for use in a local area network  
for transmitting data among networked devices, the wireless access point comprising:  
transceiver means for wireless receiving and transmitting a data signal among said  
networked devices; and  
controller means for controlling said transceiver means to receive and transmit said  
data signal among networked devices within range of said transceiver means so as to  
wirelessly relay said data signal among said networked devices in accordance with a  
designated recipient device of said data signal;

said wireless access point further comprising a weatherproof housing and electrical  
power connector for connection with a power supply for powering said wireless access point  
such that said wireless access point is configured to be deployed outside.

24. (currently amended) A system including a wireless data local-area-network  
that supports wireless portable devices, the system comprising:

40002-0007

09/613,616

a plurality of wireless access points in said network which receive wireless transmissions from said portable devices;

a processor for determining a location of a portable device based on transmissions received by any of said plurality of access points from said portable device, wherein said processor may be in said wireless portable device or may be in an access point or other networked device;

wherein a functionality of said portable device is controlled altered in response to said determined location.

25. (cancelled)

26. (original) The system of claim 24, wherein said portable device comprises a wireless phone unit that controls a ringer volume according to said determined location.

27. (original) The system of claim 24, wherein said portable device comprises a wireless phone unit that controls a voice mail feature according to said determined location.

28. (original) The system of claim 24, wherein said portable device is a personal digital assistant which provides different features or information according to said determined location.

29. (currently amended) A method of controlling a wireless portable device which is part of a wireless data local-area-network that supports wireless portable devices, said network further comprising a plurality of wireless access points which receive wireless transmissions from said portable device, and a device, which is incorporated into said portable device or into said network, for determining a location of said portable device based on transmissions received by any of said plurality of access points from said portable device,

40002-0007

09/613,616

the method comprising controlling altering a functionality of said portable device in response to said determined location.

30. (new) The method of claim 29, wherein said portable device comprises a wireless phone unit, and said method further comprises automatically adjusts a ringer volume of said wireless phone unit based on conditions of said determined location.

31. (new) The method of claim 30, wherein said method comprises increasing said ringer volume if said determined location has conditions comprising ambient noise.

32. (new) The method of claim 30, wherein said method comprises decreasing said ringer volume if said determined location is a conference room.

33. (new) The method of claim 29, wherein said portable device comprises a wireless phone unit with voice mail, and said method further comprises automatically activating and deactivating a ringer of said wireless phone unit in response to said determined location, wherein at least one location within an area of said network is associated with having said ringer deactivated.

34. (new) The method of claim 29, wherein said portable device is a personal digital assistant, and said method further comprises providing different features or information in response to said determined location.

35. (new) The method of claim 29, wherein said portable device is a personal digital assistant, and said method further comprises adjusting an amount of time prior to a scheduled event that an alert of said event is given based on said determined location and a

40002-0007

09/613,616

distance between said determined location and a location associated with said scheduled event.

36. (new) The wireless access point of claim 5, wherein said housing further comprises a second light bulb socket for providing power to a light bulb in said second light bulb socket by drawing power from said light bulb socket to which said wireless access point is connected through said threaded connector.

37. (new) The wireless access point of claim 4, wherein said prongs are configured to be selectively retracted into, and extended from, said housing for, respectively, storage and use.
